

SEALING RING EXTRACTOR

MANUAL
6039070

SEALING RING EXTRACTOR UNIVERSAL

Art.-No. 6039070 [legally protected]

No.	PART.-NR.	Description	90417820
1	6039071	Extraction Cone (screw)	1
2	6039072	Claw	1
3	6039073	Extraction Rod	1
4	6039074	Knurled Pipe	1
5	6039076	Guidance With Female Hexagon	1
6	6039077	Knurled Actuator	1

1.

The knurled actuator of the sealing ring extractor must be freely movable and should have some play (see picture) from the knurled pipe.

2.

Get a new sealing ring and place it on the extraction claw in order to adjust the grip depth. The length of the claw can be changed by turning. The claw is optimally adjusted when the collar protrudes minimally over the sealing ring (see picture). If the collar protrudes too much, then the Extractor will jam in the bore of the nozzle. If the claw is not adjusted enough, then the Extractor will not grip the sealing ring.

3.

After being used several times it can happen that the four claw elements get overstretched and do not fit in the sealing ring anymore. This can be corrected by squeezing them together with a pair of long-nosed pliers.

4.

Place the Extractor in the shaft and grip the sealing ring by turning the knurled actuator and holding the knurled pipe. Extract the sealing ring from the shaft. Additionally you can lever it out using a spanner on the extractor.
